Frontend & Full-Stack Developer Data-Driven Web Applications

[Portfolio](#) | [LinkedIn](#) | [GitHub](#)

Frontend & Full-Stack Developer with an engineering background and commercial freelance experience building practical, data-driven web applications using React, TypeScript, JavaScript, Node.js and PostgreSQL. Experienced developing frontend and backend features, integrating external APIs, working with complex data and collaborating through Git-based workflows. Enjoys turning information-heavy problems and complex workflows into clear, intuitive applications that help users make better decisions.

Technical Toolkit

Frontend: React, TypeScript, JavaScript (ES6+), HTML5, CSS3, Vite

Databases: PostgreSQL, Supabase, SQLite, SQL

Backend & APIs: Node.js, Express.js, REST APIs, Serverless Functions

Testing & Tools: Jest, Git, GitHub, Postman, Vercel, Render, VS Code

Selected Projects

First Step Jobs ([Code](#) | [Live Site](#))

April 2026

React, Node.js, Express.js, REST APIs, Jest

Full-stack software application combining React with Node.js and Express backend services to aggregate and process data from multiple external APIs. Engineered around reliable data handling, including normalisation, de-duplication, asynchronous processing, caching and automated testing.

- Built reusable responsive React interfaces featuring dynamic search, filtering, pagination and personalised recommendations, integrating REST APIs through a Node.js and Express backend.
- Engineered processing logic to merge, normalise and de-duplicate inconsistent API responses, producing cleaner and more reliable data for the frontend.
- Implemented asynchronous request handling, caching and backend-driven pagination to improve application performance, reduce unnecessary external requests and keep data-heavy user interactions responsive.
- Wrote Jest tests covering vacancy processing, distance calculations and commute logic, while using persistent client state to support personalised matching and saved-job workflows.

Film Finder ([Code](#) | [Live Site](#))

July 2026

JavaScript, TMDB API, Vercel Serverless Functions, LocalStorage

Single-page JavaScript application focused on personalised film discovery, accessible user interaction and dynamic filtering using external REST APIs.

- Built Vercel serverless API endpoints to communicate asynchronously with the TMDB service, separating external API handling from the browser and returning structured data to the client.
- Developed a recommendation scoring system that combines ratings, popularity, selected filters and user feedback to surface more relevant choices.
- Designed filtering and release-period controls with LocalStorage persistence, helping users refine their search and return to previous discovery choices.

FreshCue ([Code](#))

August 2026

React, TypeScript, Node.js, Express.js, PostgreSQL, REST APIs

Full-stack food inventory and recipe-planning application designed to turn household inventory data into practical actions by prioritising expiring food and suggesting recipes using ingredients already available.

- Built and connected frontend and backend inventory functionality, including adding, editing and deleting food items, with persistent PostgreSQL storage and structured API routes.
- Integrated an external recipe API to generate real recipe suggestions from active inventory ingredients, isolating provider-specific logic within the backend and mapping responses into the application's own data model.
- Implemented ingredient matching and recipe ranking logic to clearly distinguish available and missing ingredients and prioritise recipes requiring fewer additional items.
- Managed development through GitHub issues, feature branches and pull requests, validating changes with frontend and backend lint/build checks and resolving implementation issues before merging.

Professional Experience

Freelance Software Developer - Self-employed (Project)

June 2026

Collaborated closely with another developer using Git, feature branches, pull requests and code reviews to design and iteratively improve a React and TypeScript application, translating a complex client brief into a maintainable multi-step software workflow.

- Mapped a detailed client brief into a clear multi-step journey covering template selection, session setup, consent, audio upload or recording, structured-output review, editable action plans, resource links and final preview screens.
- Designed controlled forms and shared application state so information remained consistent across screens and changes flowed through the prototype.
- Used simulated audio and transcription data to test the complete workflow honestly, validating the user experience without presenting the prototype as a finished AI transcription system.
- Collaborated through GitHub Projects, issues, feature branches, pull requests and code reviews, breaking work into incremental changes and using feedback to improve implementation quality.

Tech: React, TypeScript, Vite, Git, GitHub

People Coordinator - Adur & Worthing Councils

July 2023 - April 2025

- Made complex employee restructuring work easier to track by collecting, validating and organising workforce data, working with Heads of Directorates, HR and Payroll to ensure changes were accurately documented and processed.
- Built and maintained shared tracking spreadsheets and documentation for staffing changes, payroll codes and contractual updates, giving stakeholders reliable information for decision-making.
- Calculated annual leave entitlements and final pay for leavers, investigating discrepancies and ensuring information submitted to Payroll was accurate and compliant with organisational policies.
- Prepared monthly workforce reports while managing multiple concurrent priorities, developing planning methods that improved organisation and enabled urgent work to be balanced alongside day-to-day responsibilities.

Learning & Development Officer - Adur & Worthing Councils

September 2021 - July 2023

- Maintained learning systems including Connect and Learning Pool, keeping training information accurate and helping employees navigate learning processes.
- Coordinated training events across Council services, translating requirements between employees, facilitators and internal stakeholders to keep delivery organised.
- Designed and delivered a series of cybersecurity training sessions, using interactive activities and quizzes to explain technical risks clearly and encourage participation.
- Managed operational processes including purchase orders, invoices and training enquiries, balancing system administration with day-to-day user support.

Graduate Project Engineer - Nasmyth Group

September 2019 - February 2020

Supported multidisciplinary engineering projects in a marine engineering environment through technical documentation, factory acceptance testing and investigation of technical issues, working across teams to identify problems, communicate findings and record outcomes in line with structured engineering and quality-assurance procedures.

Education & Training

Software Development Bootcamp - TechNative Digital

October 2025 - December 2025

- Completed practical software training in JavaScript, React and Git/GitHub, alongside independent study and project work using Node.js, REST APIs, PostgreSQL, SQL and backend software development principles.

Level 3 Learning & Development Practitioner - Pass

2021 - 2023

MEng Aerospace Engineering (Merit) - University of the West of England

September 2015 - June 2019

- Received the Dean's Award.
- Developed a Model Predictive Controller for aircraft-wing flutter suppression using MATLAB and Simulink, applying mathematical modelling, simulation and control-system principles to a complex engineering problem.
- Technical study included C programming, Systems Engineering, Control Systems and mathematical modelling.
